

Conquering Micro-services

with  GraphQL

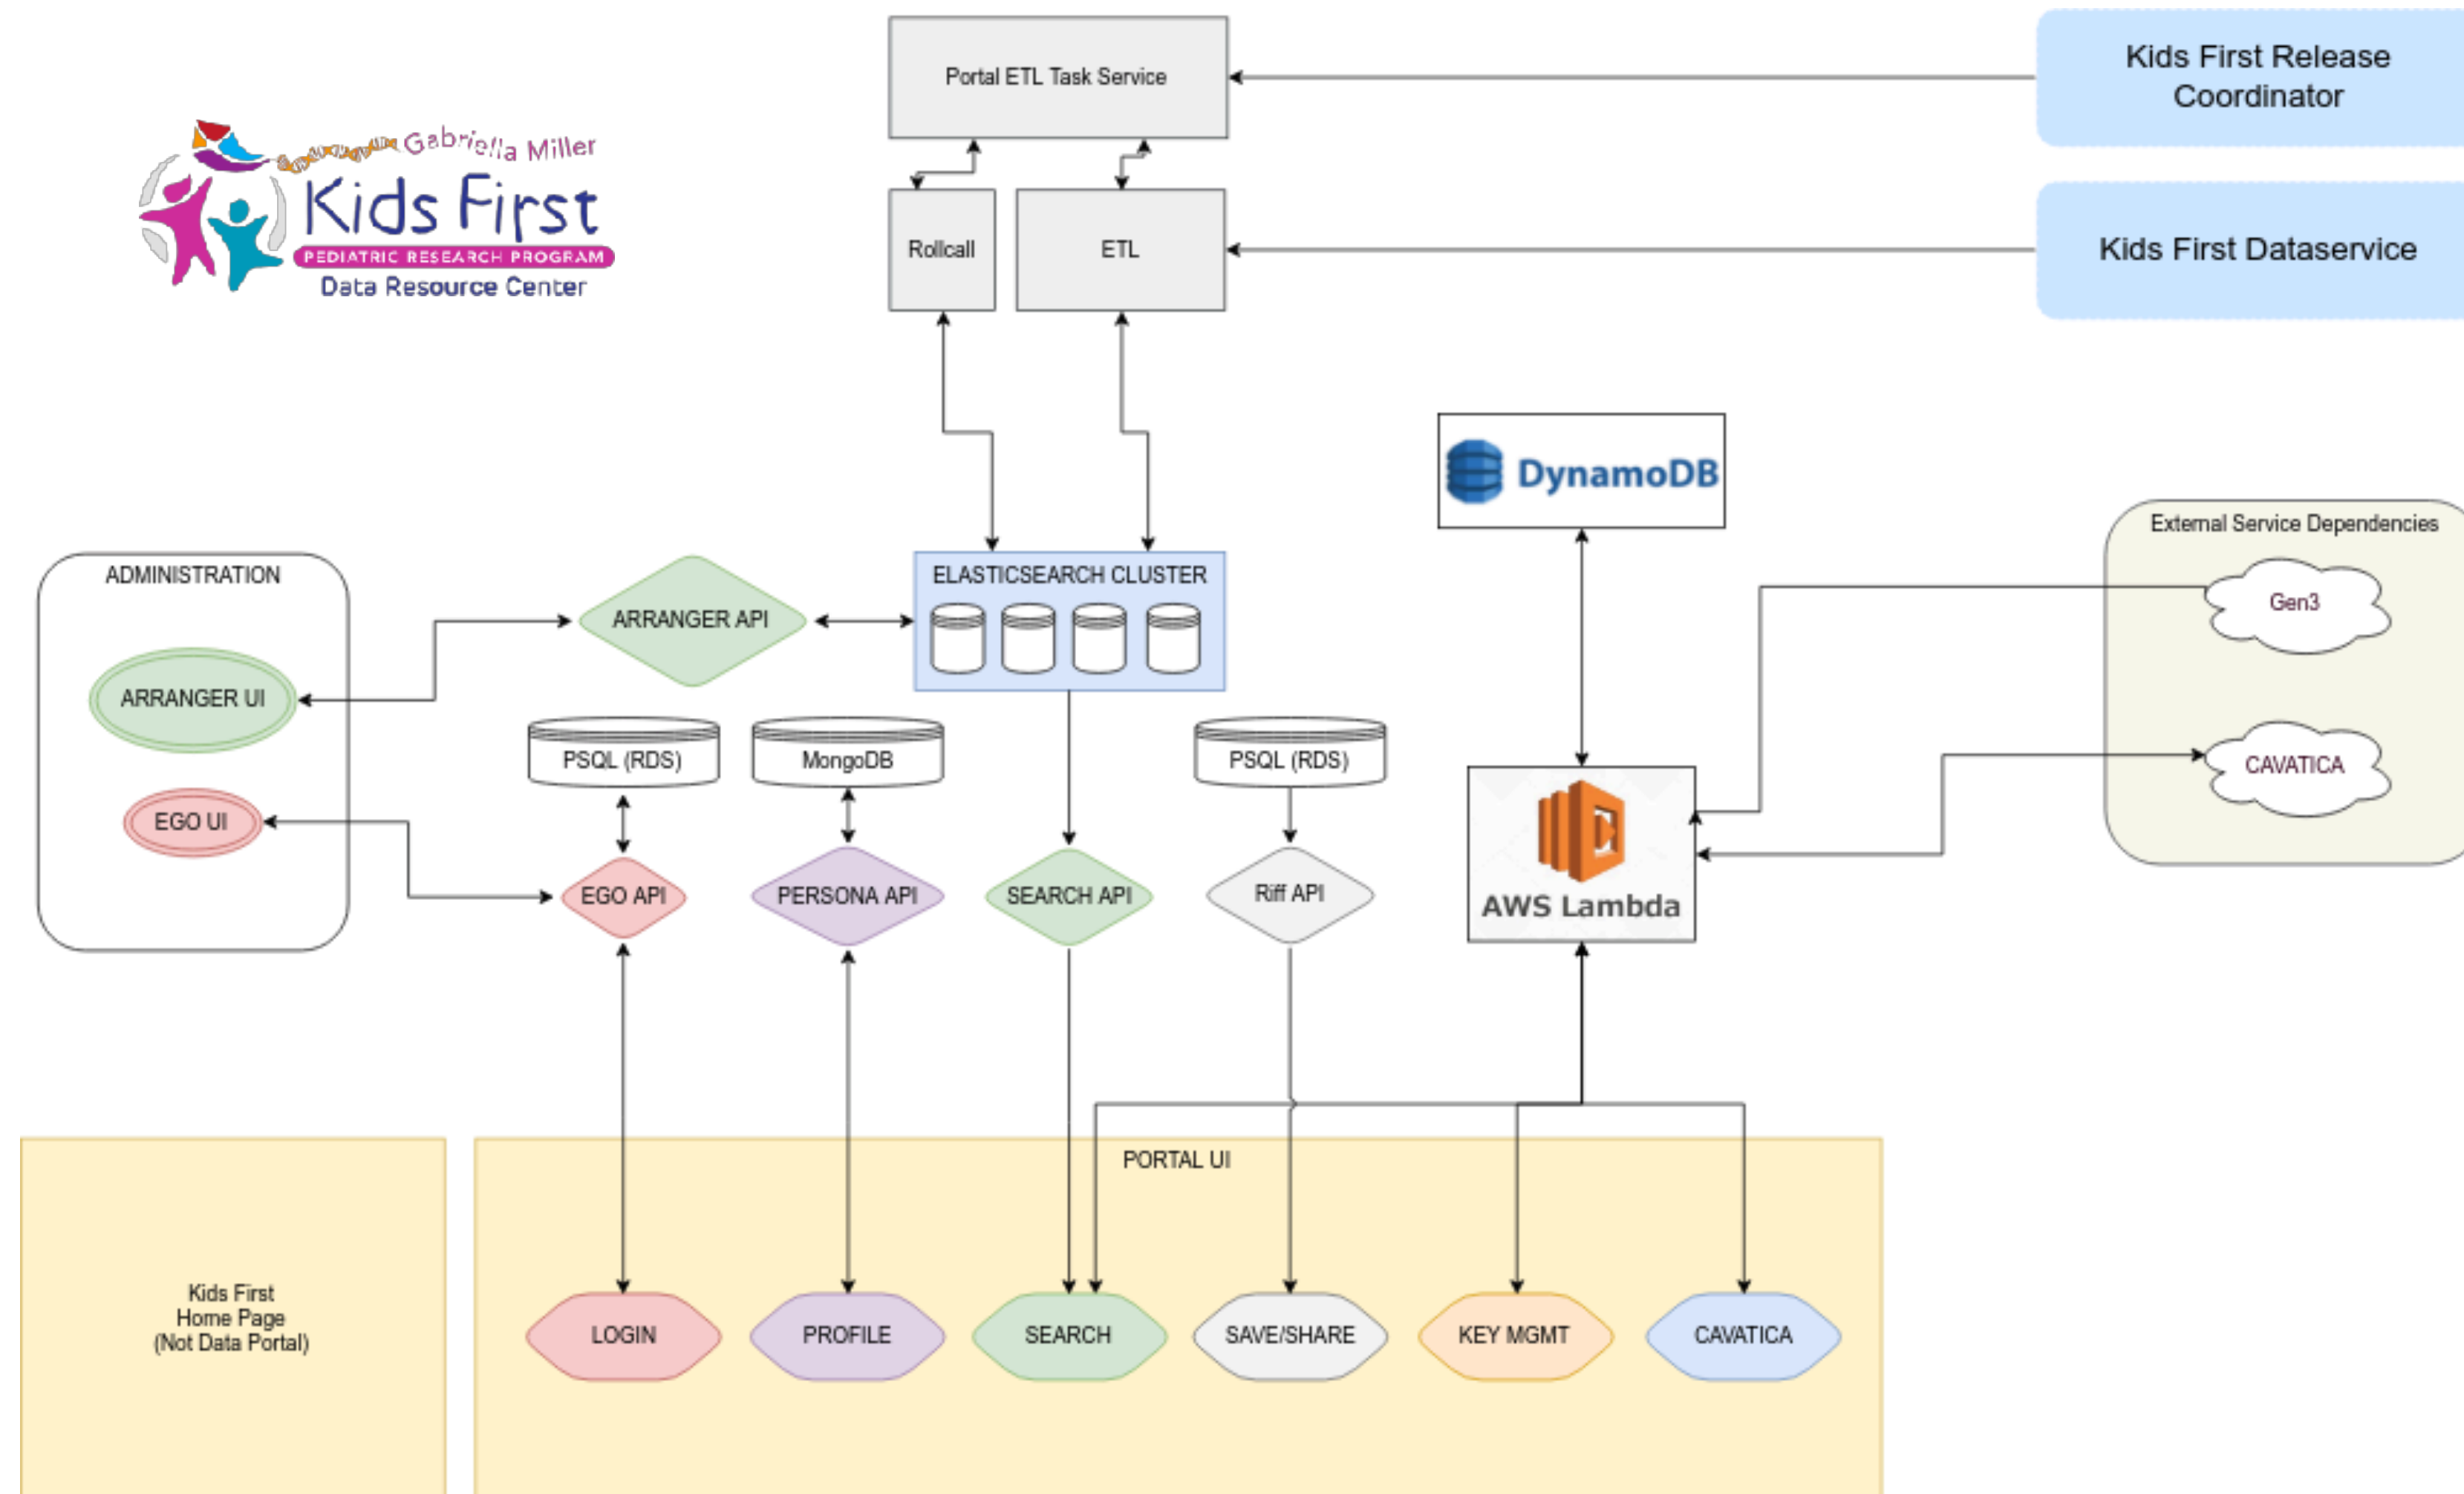

Our plan for 

from  softeng with  

and more...

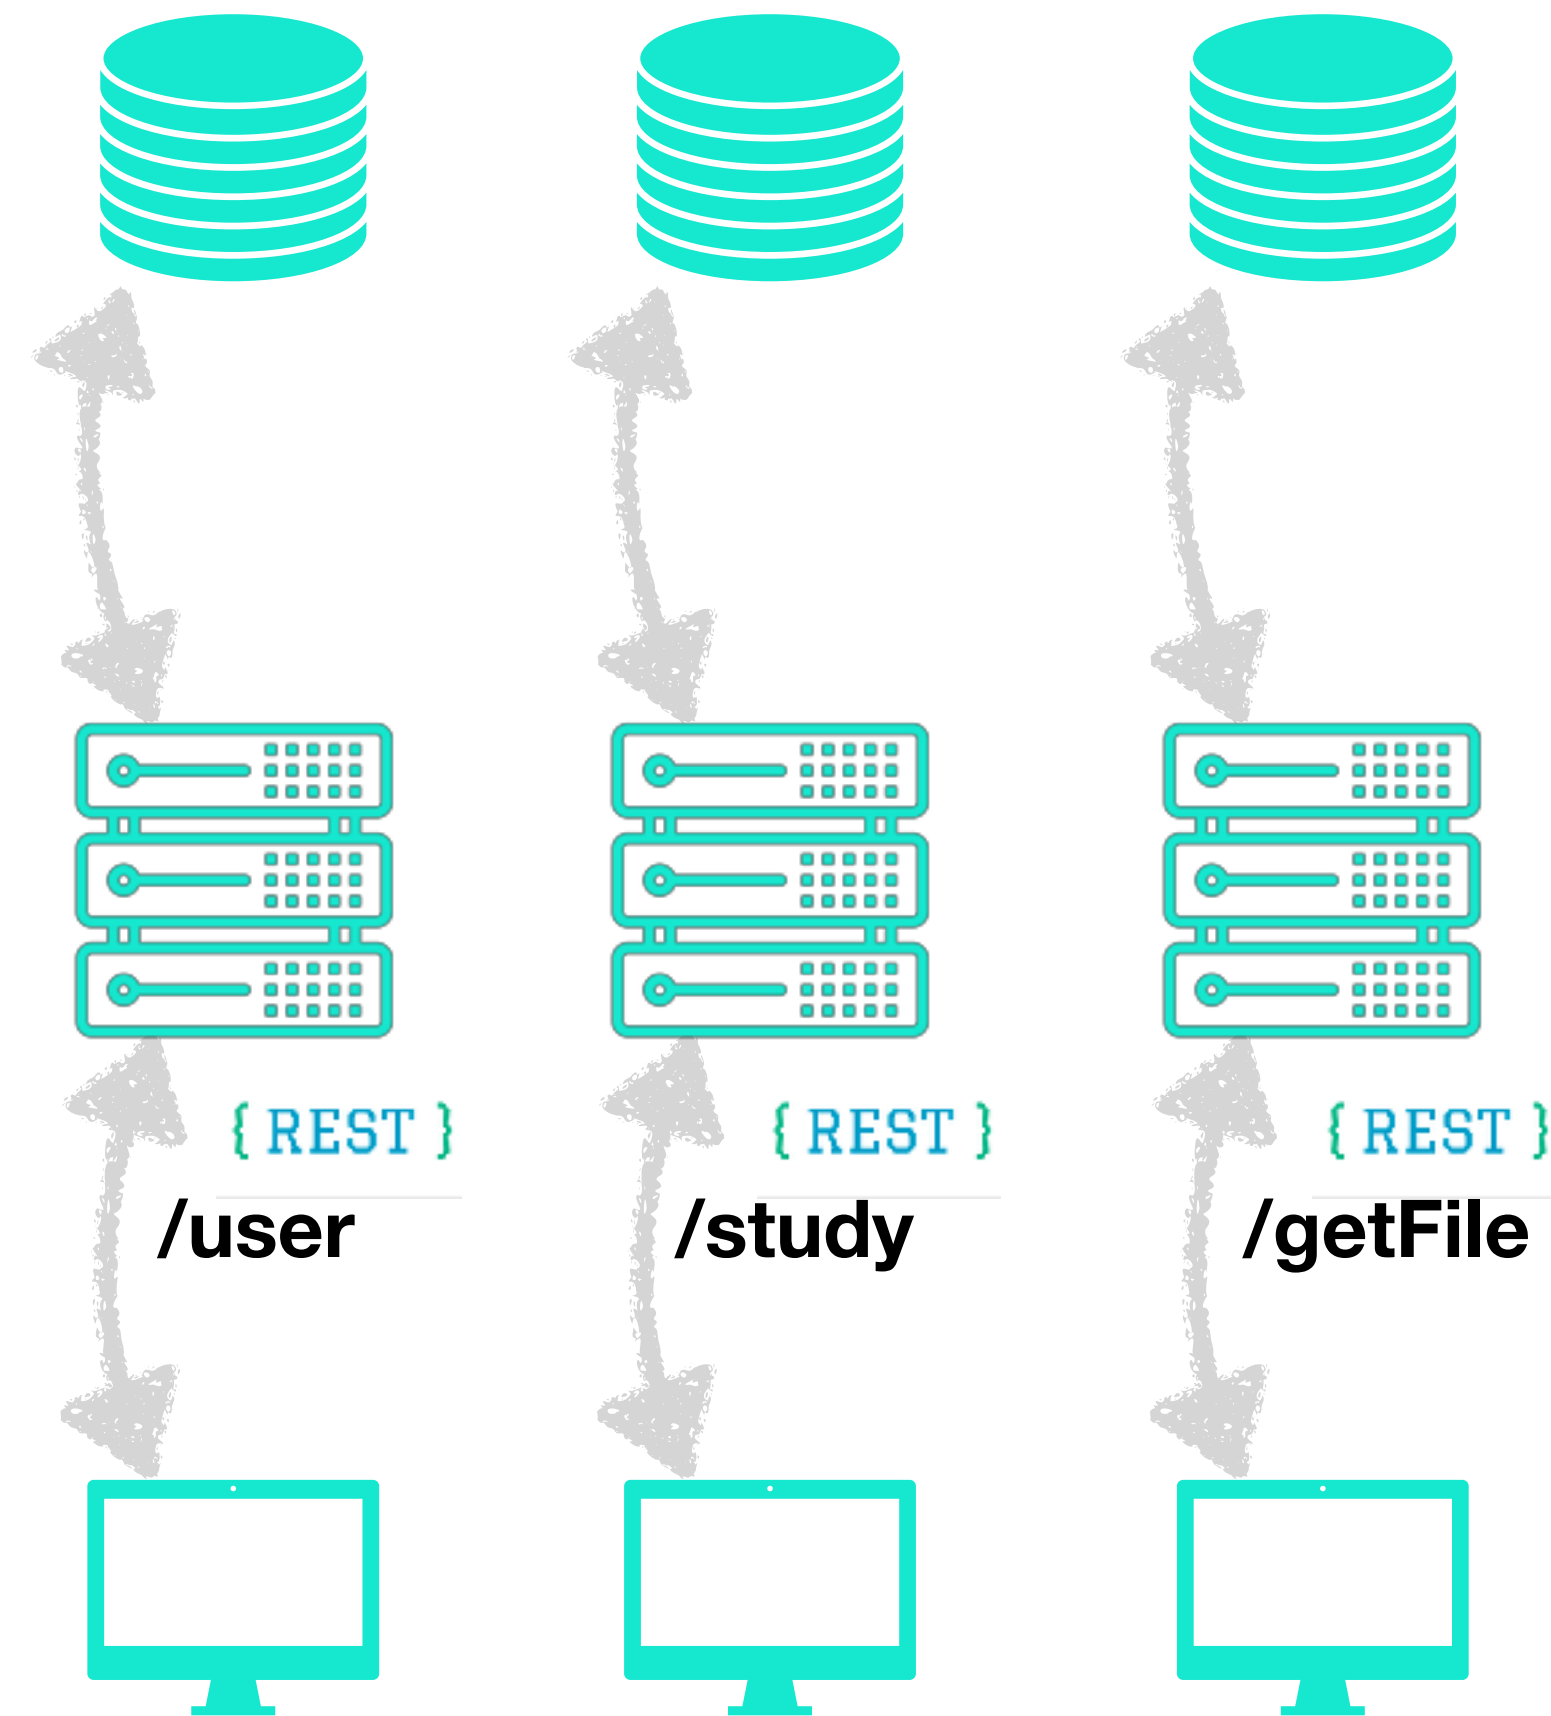

Behind the scene

Monolithic System

Micro-...what?

Micro-services System

- Functionally decoupled
- Independently deployable
- Independently scalable

Some challenge

- No place to handle cross-cutting concerns
- Front-end handles heavy business logic
- Inefficiencies with **REST**:
 - Over & under-fetching
 - Lack of API schema -> manual documentation

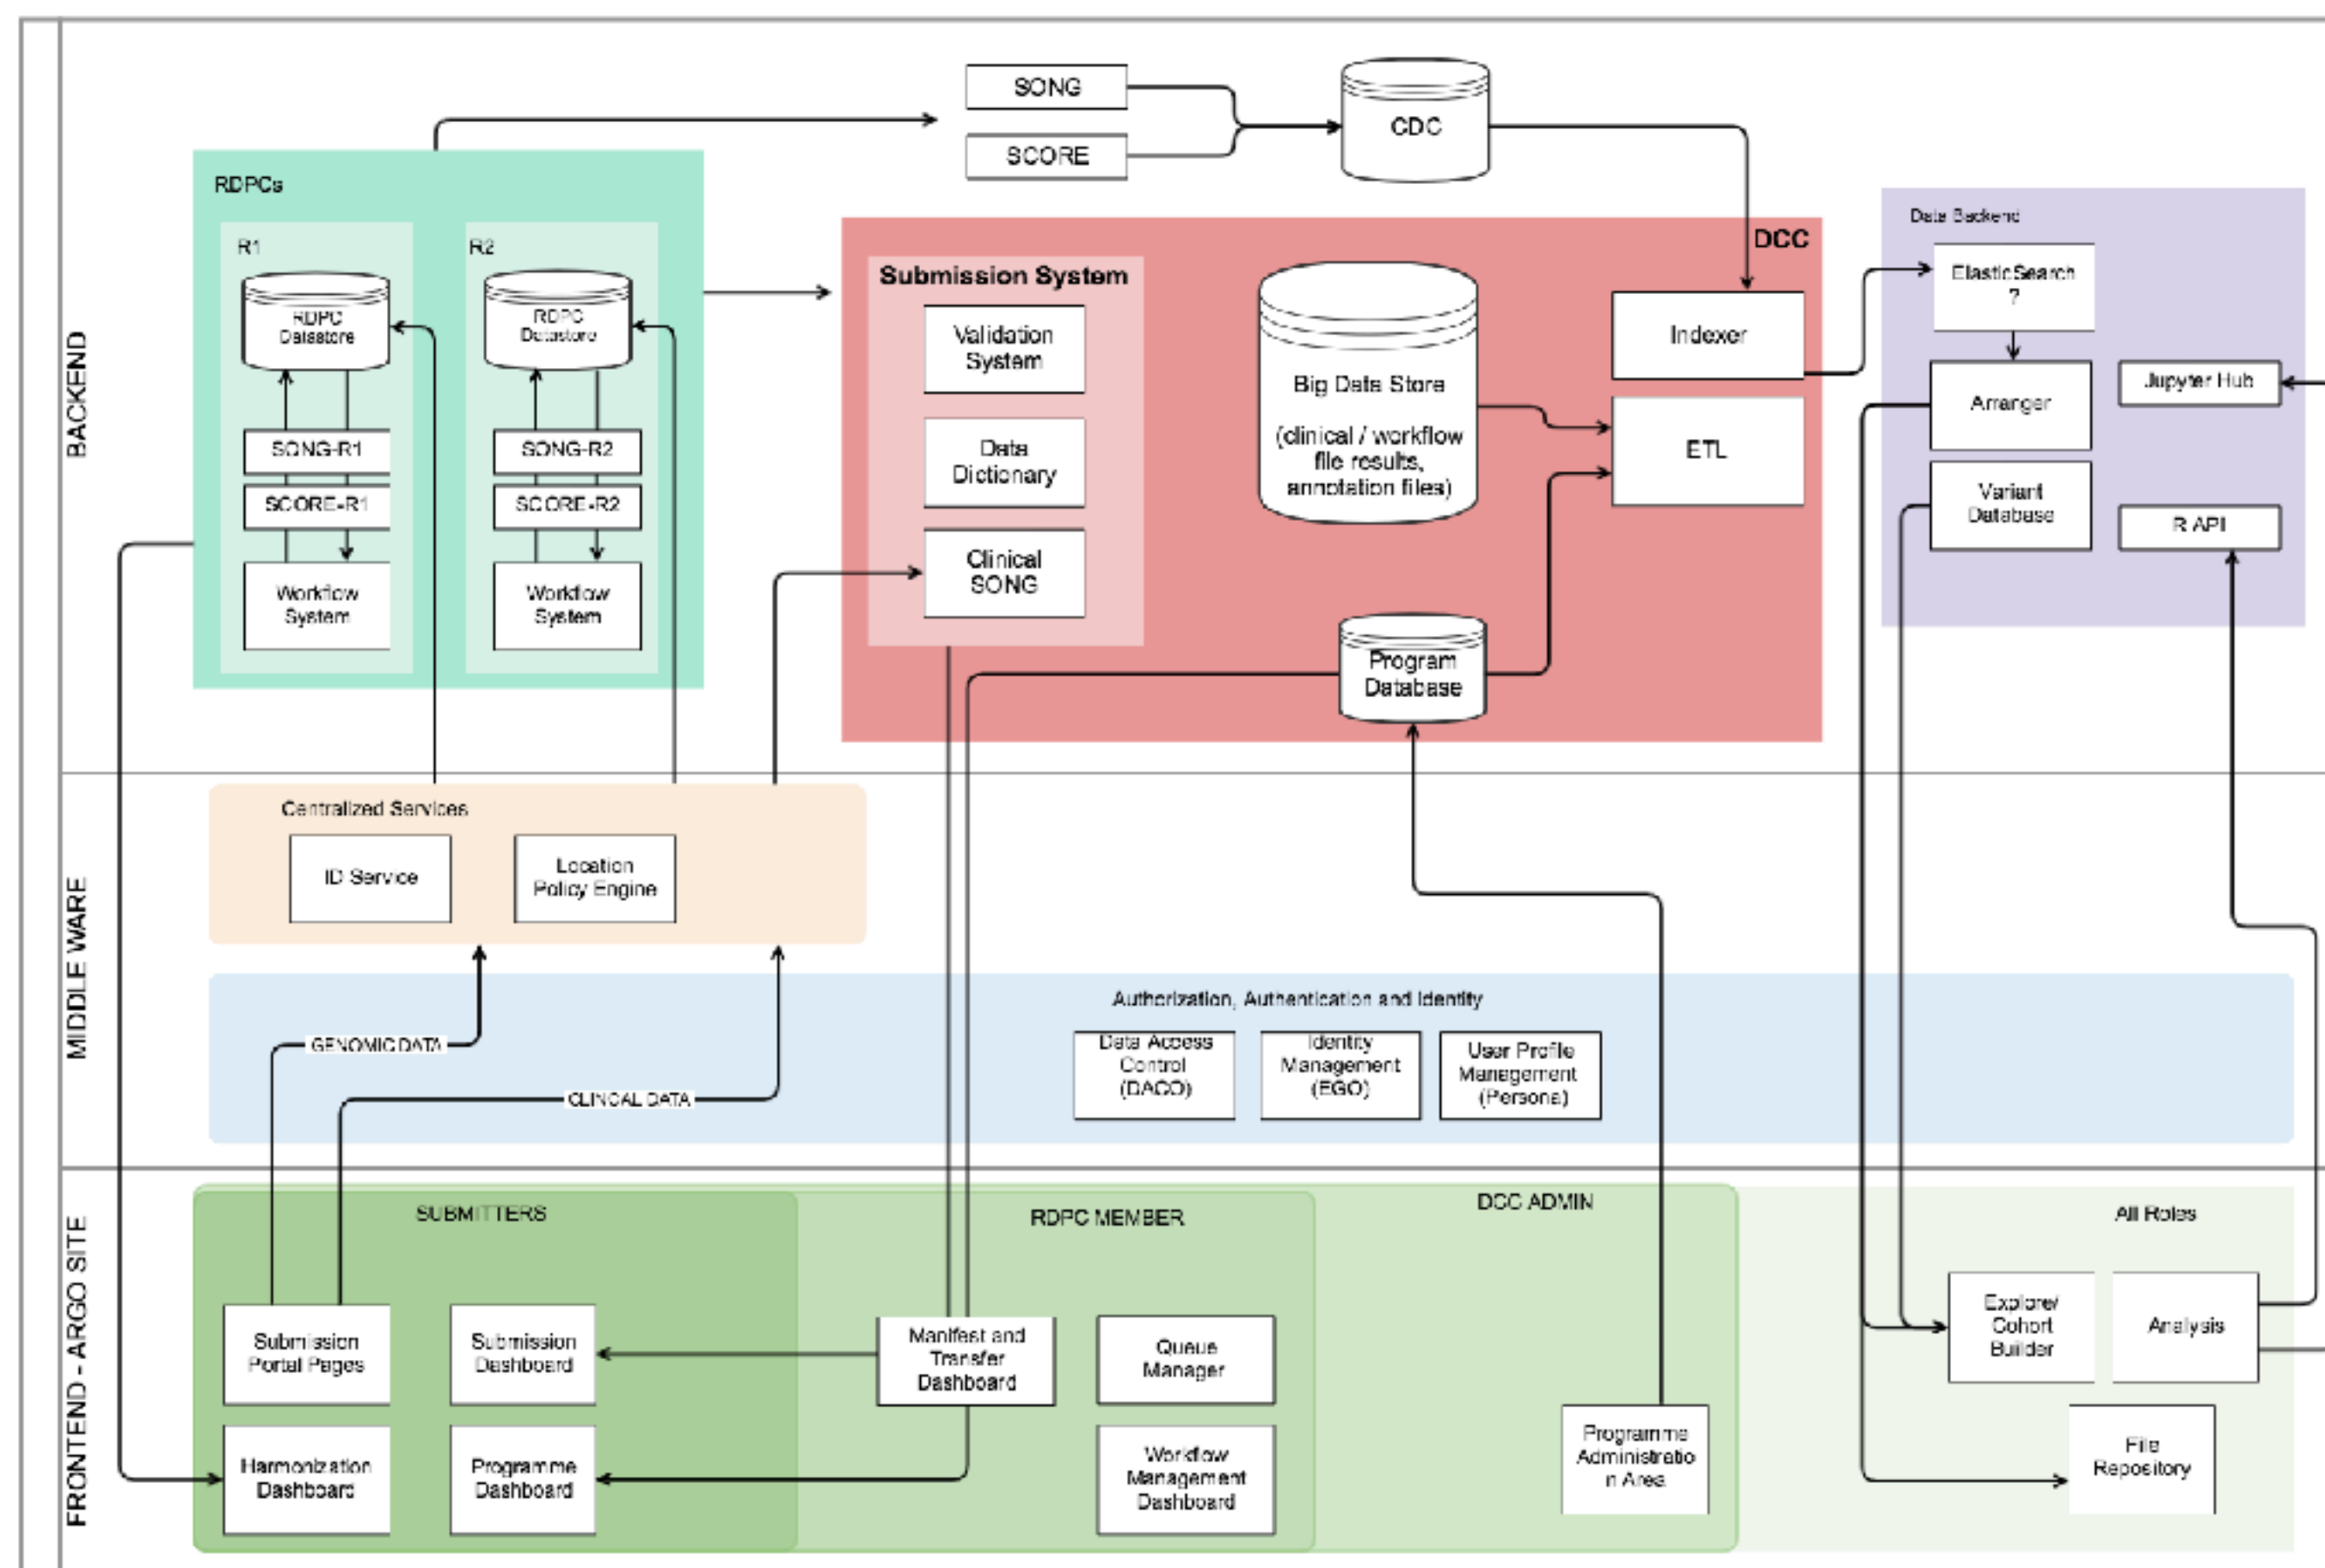

The GraphQL Solution

- An **aggregation layer** to handle cross-cutting concern
- **Why GraphQL?**
 - Explorable schema —> self-documenting
- **Schema Stitching:**
 - Modelling underlying services as an independent schemas
 - “Stitch” the schemas together as nodes in a graph
 - Network advantage: batched request

BRACE YOURSELF

ARGO IS COMING

demo

user service

program service

gateway

The wins

- Explorability:
 - Better developer on-boarding
 - Collaboration with non-technical team members
- Central place for integration test —> higher quality software
- Network performance

thank you
